

I went to the Vivero lab and showed them my implementation. I was advised to add in descriptions and an introduction page to let users know what data they are looking at and what each visualization is trying to convey. Also, for my network I was having trouble deciding how to put all the opponents on the screen at once, and one of the mentors mentioned that I should try filtering by the tournament which was a fantastic suggestion. This suggestion was able to make my network information more interesting in concept and also less cluttered to view.
